Remote procedure call is an inter-process communication that allows a program to cause procedure to execute in another address space without explicitly coding the details for this remote interaction.

I have 3 classes: CalculatorServer.java, CalculatorClient.java, CalculatorGUI.java

And 1 interface: Calculator.java

Program runs CalculatorGUI.java. Pressing on buttons calls actions in CalculatorServer.java.

CalculatorServer.java implements all functions of calculator.
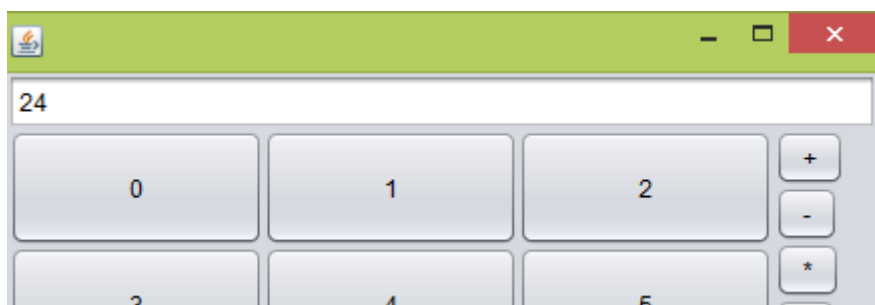

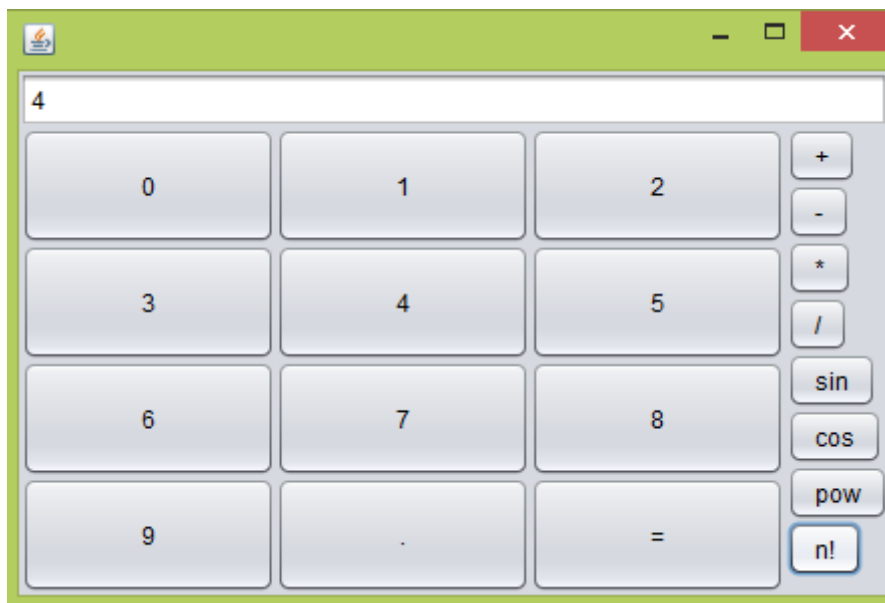

This is how my application looks.

Calculating cos(30)

Calculating sin(30)

Calculating factorial 4

Divide 80/2
